**Order code**

The item designation JM-1xxx-xxxxxx provides you with information about the specific design variant of the servo amplifier delivered to you. You can take the meaning of the individual positions in the item designation from the following order code. You can find a complete order code with all values in the Jetter industrial automation catalog.

Fig. 1 Order code JM-1432
You will find the serial number on the nameplate of JM-1432 servo amplifier, from which you can read the manufacturing data according to the following code. The positions where the nameplates are attached to the JM-1432 are listed in Fig. 5 on page 21.

The serial number contains information about:
- Year of production: here, 16
- Week of production: here, 17
- Manufacturing code: here, 0
- Parts per week: here, 1234

The CE declaration of conformity is part of the document “STO JM-1000” which has been published in 24 languages (item no. 60879033, file name: jm-1000_ba_xxx_dokumentation_sto_de-en.pdf, ). The file is on a CD which comes with this servo amplifier.

The scope of delivery includes:
- Servo amplifier JM-1432
- Terminal accessories kit for control and power terminals (depending on device performance and variant)
- Product DVD
Pictograms

Pictograms are used in these operating instructions to improve orientation; their meaning is described in the following table. The meaning of each pictogram is always the same even when it appears without text, such as when it is placed next to a connection diagram.

1 Safety

1.1 Measures to ensure your safety

To prevent injury and/or property damage, please read the following information before initial commissioning. Observe the safety instructions at all times.

**NOTICE**

First read the operating instructions!

- Observe the safety information!
- Observe the user information!

**Electric drives are fundamentally dangerous:**

- Electrical voltages from 230 V to 480 V
- Dangerous high voltages ≥ 50 V may be present even 30 minutes after disconnection from mains power (capacitor charge).
  Therefore check that no voltages are present!
- Rotating parts
- Hot surfaces

**Protection from magnetic and/or electromagnetic fields during installation and operation:**

Persons with heart pacemakers, metallic implants or hearing aids, etc. must not enter the following areas:

- Areas where drive systems are installed, repaired or operated.
- Areas where motors are installed, repaired or operated. Motors with permanent magnets are particularly dangerous.
- If it is necessary to enter these areas, first consult a doctor for a decision if this is safe.

**Your qualification:**

- To prevent injury and property damage, only qualified personnel with an electrotechnical education are permitted to work on the device.
- The qualified person must be familiar with the operating instructions (cf. IEC 364, DIN VDE 0100).
- Knowledge of the national accident prevention requirements (e.g., BGV A3 in Germany)
During the installation, pay attention to:

- Compliance with connection conditions and technical data is mandatory.
- Observe the standards for electrical installation, such as conductor cross-section and protective and ground cable connections.
- Do not touch electronic components or contacts (electrostatic discharge can destroy components).

1.2 Warning symbols

The safety instructions describe the following danger classes. The danger class describes the risk when the safety instructions are not followed.

<table>
<thead>
<tr>
<th>Warning symbols</th>
<th>General explanation</th>
<th>Danger class to ANSI Z 535</th>
</tr>
</thead>
<tbody>
<tr>
<td>!</td>

</tr>
<tr>
<td></td>
<td>The drive can start up automatically.</td>
<td></td>
</tr>
</tbody>
</table>

Table 1 Explanation of warning symbols

1.3 Intended use

JM-1000 servo amplifiers are built-in devices intended to be incorporated into stationary, industrial and commercial systems or machines.

When the servo amplifier is installed in a machine, commissioning (i.e., the start of intended operation) is prohibited until it has been determined that the entire machine complies with Machinery Directive 2006/42/EC; observe EN 60204.

Commissioning, i.e., the start of intended operation, is only permitted when EMC Directive (2004/108/EC) is complied with.
The JM-1432 servo amplifier complies with the Low-Voltage Directive 2006/95/EC.

The servo amplifier satisfies the requirements of the harmonized product standard EN 61800-5-1.

If the servo amplifier is used in special application areas, such as in potentially explosive atmospheres, it is imperative that the applicable requirements and standards (e.g., in EX areas, DIN EN 60079-0 General Provisions and DIN EN 60079-1 Flameproof enclosure) are observed.

Only authorized repair centers are permitted to carry out repairs. Independent, unauthorized repairs can lead to death, injury and property damage, and will invalidate the warranty from Jetter AG.

**NOTICE**
The use of the servo amplifier in non-stationary equipment constitutes an exceptional environmental condition and is only permitted after special agreement.

### 1.4 Responsibility

Electronic devices are inherently not immune to failure. The constructor and/or the operator of the machine or system is responsible for ensuring that if the device fails, the drive will be set to a safe state.

In EN 60204-1/DIN VDE 0113 *Safety of machinery*, safety requirements for electrical controls are presented under the topic *Electrical equipment of machines*. These requirements are intended to protect persons and machinery and to maintain the functional capability of the machine or system, and must be observed.

The function of emergency stop equipment is not necessarily required to switch off the power supply to the drive. To avert dangers, it can be sensible to keep individual drives in operation or to initiate specific safety procedures. The design of the emergency stop measures was evaluated during a risk assessment of the machine or system, including the electrical equipment, complying with DIN EN ISO 12100:2011-03 (formerly DIN EN 14121) and determined with selection of the switching category according to EN ISO 13849-1 (formerly DIN EN 954-1) *Safety of Machinery - Safety-related parts of control systems*. 
2 Mechanical installation

2.1 Information on mechanical installation

ATTENTION!
During mechanical installation
- Be absolutely certain that no drilling chips, screws or other foreign objects fall into the device.
- Be absolutely certain that no moisture penetrates into the device.

Control cabinet
- This device is intended exclusively for installation inside a stationary control cabinet. The control cabinet must satisfy at least protection class IP4x.
- When the safety function STO (Safe Torque OFF) is used, according to EN ISO 13849-2 the control cabinet must have a protection class of IP54 or higher.

Environment
- Do not install servo amplifiers in areas where they will be exposed to continued shocks. You will find additional information in Table 38 on page 60 of the Appendix.
- The device heats up during operation and can reach temperatures of up to 100 °C at the heat sink. Take this into account for adjacent components.

The following basic rules apply to installing the servo amplifier:

Cooling
It must be possible for cooling air to flow through the device with no obstructions. When installing in control cabinets with natural convection (= heat loss is discharged to the outside via the control cabinet walls), always provide an internal fan.

Installation to EMC rules
The best results for installation complying with EMC requirements are achieved with a well-grounded chrome- or zinc-plated mounting plate. If the mounting plates have been painted, remove the paint from the contact areas!

Pollution
Maximum pollution degree 2 per EN 60664-1. You will find additional information about the environmental conditions in Table 36 on page 59 of the Appendix.
If you would like more detailed information about mechanical installation, please contact the Jetter hotline, see page 53.
# 2.2 Mechanical installation

Mechanical installation

Fig. 3 Mounting distances for air cooling (BG4)
**NOTICE**

The minimum distance $E$ entered in the table for installation size BG4 applies to devices of identical output. When installing different drive outputs in a row, be sure they are in a staged arrangement according to output. This minimizes mutual thermal influences.

When installing JM-1432 servo amplifiers in a row with other devices, make sure the devices do not thermically influence each other.

Fig. 4 Mounting distances for air cooling (BG4)
3 Installation

3.1 Information on installation

ATTENTION!

Qualified personnel

- Only qualified personnel who have completed an electrotechnical education and been instructed in accident prevention are permitted to carry out the installation.

During the installation

- Be absolutely certain that no screws, cable remains or other foreign bodies fall into the device.
- Be absolutely certain that no moisture penetrates into the device.

DANGER of electrical voltage!

Risk of death!

- Never wire or loosen live electrical connections!
- Before performing any kind of work, disconnect the device from the mains supply (AC 230/400/460/480 V).
  Dangerous high voltages ≥ 50 V may be present even 30 minutes after disconnection from mains power (capacitor charge). Only work on the device when the DC link voltage has fallen below a residual voltage of 50 V, measured at terminals X12/L-.
- Even if no optical or acoustic signals/signs are apparent or perceptible on the device, dangerous high voltage may be present on the device (e.g., with mains voltage switched on at terminal X11 and there is no +24 V control supply at X9/X10)!

Compliance with EMC product standards

- Commissioning (i.e., the start of intended operation) is only permitted when EMC standard EN 61800-3 is observed.
- Verification of compliance with the safety objectives required by the standard must be provided by the constructor/operator of the machine and/or system.

Cable type

- Use shielded mains, motor and signal cables with doubled copper braiding providing 60 to 70 % coverage.
- If very large conductor cross-sections need to be laid, shielded single wires can be used instead of shielded cables.
Laying cables

- Lay mains, motor and signal cables separated from each other.
- Maintain a distance of at least 0.2 m; use separator plates if necessary.
- Always route motor cables along the shortest way to the control cabinet without interruption. If a motor protection switch or a motor choke is used, position the components directly on the servo amplifier and do not remove the motor cable shielding too soon.
- As much as possible, only route the signal cables into the control cabinet from one side.
- Twist cables of the same electric circuit together.
- Avoid unnecessarily long cable lengths and loops.

Grounding measures

- The grounding measures pertinent to the servo amplifier are described in chapter 3.5 Connecting protective earth on page 25.

Shielding measures

- Do not remove the cable shielding too soon and always lay it to both the components and the PG rail (primary ground) of the mounting plate with as great a surface as possible.

External components

- Place larger consumers near the electric supply.
- Always wire contactors, relays, solenoid valves (switched inductances) with surge protectors. The wiring must be directly on the respective coil.
- Switched inductances should be at least 0.2 m distant from process-controlled assemblies.

NOTICE

You will also find supplementary information in the respective description of connections. If you would like more detailed information about installation, please contact the Jetter hotline, see page 53.

![Diagram showing protective earth connections](image-url)

Fig. 7 Laying the protective earth connections in a star configuration
3.6 Electrical isolation concept

The control electronics with their logic (µp), the encoder connections and the in- and outputs are galvanically isolated from the power unit (mains supply/DC link). All control connections are executed as safety low voltage circuits (SELV/PELV) and must only be operated with such SELV or PELV voltages in accordance with the respective specifications. This means a secure protection from electric shock on the control side.

Therefore it needs a separate power supply which corresponds to the requirements for an SELV/PELV.

The following overview details the potential references of the individual connections.

This concept also gains higher operating reliability for the servo amplifier.

ATTENTION!

The isolation and separation of terminal X5 (motor PTC) represent a special feature. For this terminal, please observe the information in chapter 3.14 Motor connections starting on page 41.

SELV = Safety Extra Low Voltage
PELV = Protective Extra Low Voltage
Fig. 8 Electrical isolation concept for JM-1432 (BG4)
3.7 Connecting the supply voltages

The JM-1432 has got an individual power supply for the control unit and for the power section. Always connect the control voltage in the series first, so the activation of the JM-1432 can be checked and the device can be parameterized for the planned application.

**DANGER of electrical voltage!**
Even if no optical or acoustic signals/signs are apparent or perceptible on the device, dangerous high voltage may be present (e.g., with mains voltage switched on at terminal X11 and at the same time, there is no DC 24 V control supply at X9/X10!)

### 3.7.1 Connecting the control supply (DC 24 V)

**ATTENTION!**
In general, suitable measures must be taken to ensure corresponding circuit breaking.

<table>
<thead>
<tr>
<th>Terminal/pin</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>X9/1 = + X9/2 = -</td>
<td>$U_v = DC 24,V \pm 20%$ (BG5 to BG6a + 20/-10 %), stabilized and smooth</td>
</tr>
<tr>
<td></td>
<td>For the maximum startup and continuous currents, see Table 35 on page 58.</td>
</tr>
<tr>
<td></td>
<td>Continuous current carrying capacity of terminal: 10 A max., internal polarity reversal protection</td>
</tr>
<tr>
<td></td>
<td>The power supply unit used must have a secure separation from the mains that complies with EN 50178 or EN 61800-5-1.</td>
</tr>
<tr>
<td></td>
<td>Connected internally with X10</td>
</tr>
</tbody>
</table>

Table 9 JM-1432 (BG4) - Control current supply specification
NOTICE  On the JM-1432, the external voltage supply supplies both the control unit and the output for the motor brake. If this output is active, the power for the control unit and the power for the motor brake and for the additional power consumption of digital in- and outputs flows through terminal X9. Take this into account when dimensioning the voltage supply for the control unit and when looping through to other devices. You will find the power consumption of the individual devices in the Appendix on page 58 in Table 35.

3.7.2 AC mains supply connection

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
<th>Remark</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Determine the conductor cross-section in dependence on the maximum current and ambient temperature.</td>
<td>The conductor cross-section must comply with local and national regulations and conditions.</td>
</tr>
<tr>
<td>2.</td>
<td>Wire the servo amplifier according to its installation size and connection type. Use a cable shielded after 0.3 mm cable length!</td>
<td>See Fig. 10.</td>
</tr>
<tr>
<td>3.</td>
<td>Wire the mains choke if needed, see chapter 3.7.2</td>
<td>This reduces the voltage distortions (THD) in the mains and increases the service life of the servo amplifier.</td>
</tr>
<tr>
<td>4.</td>
<td>Install a circuit breaker K1 (power switch, contactor, etc.).</td>
<td>Do not switch on the AC mains supply yet!</td>
</tr>
<tr>
<td>5.</td>
<td>Use mains fuses (operating class gG, see Table 11) that separate the servo amplifier from the mains at all poles.</td>
<td>To comply with equipment safety to EN 61800-5-1</td>
</tr>
</tbody>
</table>

Table 10 AC power supply connection

**DANGER of electrical voltage!**

**Risk of death!**

Never wire or loosen live electrical connections! Before performing any kind of work, disconnect the device from the mains supply. Dangerous high voltages \( \geq 50 \text{ V} \) -may be present even 30 minutes after disconnection from mains power (capacitor charge). Therefore check that no voltages are present!

**ATTENTION!**

If local regulations require providing a residual current device, the following applies:

In case of fault, the servo amplifier can generate DC fault currents without zero crossing. Therefore only operate the servo amplifier with residual-current-operated protective devices (RCDs)\(^1\) type B for AC residual currents, pulsating or smooth DC fault currents, that are suitable for servo amplifier operation, see IEC 60755. In addition, residual current monitoring devices (RCMs)\(^2\) can be used for monitoring tasks.

\(^1\) Engl.: residual current protective device
\(^2\) Engl.: residual current monitor
Please note:
Switching the mains voltage:
- At switching too frequently, the device protects itself by high-impedance disconnection from the mains; after a recovery phase of several minutes, the device is ready for operation again.

TH and TT mains: Operation is permitted in the following cases:
- For single-phase devices with 1 x AC 230 V, the supply mains corresponds to maximum overvoltage category III to EN 61800-5-1.
- For three-phase devices with the external conductor voltages 3 x AC 230 V, 3 x AC 400 V, 3 x AC 460 V and 3 x AC 480 V, the star point of the supply mains is grounded and the supply mains is suitable for maximum overvoltage category III to EN 61800-5-1 at a system voltage (external conductor → start point) of maximum 277 V.

IT network: not permitted!
- With ground connection, the voltage stress is about doubled. Clearance and creepage distances to EN 61800-5-1 are no longer maintained.

It is imperative that the servo amplifier is connected via a mains choke in the following situation:
- If the servo amplifier is used in applications with disturbance variables corresponding to environment class 3, to EN 61000-2-4 and above (harsh industrial environments).
- For compliance with EN 61800-3 or IEC 61800-3, see Appendix.

For additional information about current carrying capacity, technical specifications and environmental conditions, please refer to the Appendix.

NOTICE
Please note that the JM-1432 is not designed for environmental class 3. To attain this environmental class, additional methods are absolutely imperative! For details, please contact your project engineer.

NOTICE
Before commissioning, set the value of the connected mains voltage in the servo amplifier (factory setting = 3 x AC 400 V).

<table>
<thead>
<tr>

<td>Max. conductor cross-section (^2) for terminals</td>
<td>16 mm²</td>
</tr>
<tr>
<td>Prescribed mains fuse, operating class gG</td>
<td>3 x max. 63 A</td>
</tr>
</tbody>
</table>

\(^1\) At 3 x 400 V mains voltage
\(^2\) The minimum cross-section of the mains connection cable complies with the local regulations and conditions and the rated current of the drive controller.
3.7.3 Applying a mains choke

Applying mains chokes:
- Required when the servo amplifier is used in harsh industrial mains grids
- Recommended for increasing the lifespan of DC link capacitors

3.7.4 Applying an internal line filter

The servo amplifiers are equipped with integrated line filters. With the measurement procedures prescribed by the standard, the drive controllers satisfy the EMC protective goals to EN 61800-3 for First environment (residential C2) and Second environment (industrial C3). For additional information, see chapter G Line filter, page 61.

**ATTENTION!**

This is a product with restricted availability to EN 61800-3. This product may cause radio interferences in residential areas; if it does, the operator may be required to take corresponding measures.
### 3.7.5 Applying an external line filter

External radio interference filters (EMCxxx) are available for the servo amplifiers. With the prescribed measurement procedures and the external line filter, the servo amplifiers also satisfy the EMC product standards to EN 61800--3 for *First environment* (residential C2) and *Second environment* (industrial C3).

To use longer motor cables and achieve compliance with EMC product standard EN 61800-3 for *General availability* (residential C1), additional external line filters are available for devices with an internal line filter (BG4).

### 3.8 Control connections

</tbody>
</table>

Table 14 Specification of control connections X4, Part 2
High ohmic separation from device ground

If currents are too high, a high ohmic separation from the device ground is possible via the ground terminal. Under some circumstances, this can lead to faulty drive operation. To prevent this, avoid circular currents in the wiring.

### 3.9 USB interface specification

Technical specification:
- USB 1.1 standard - full-speed device interface
- Connection through typical USB interface cable type A to type B
3.10 Ethernet interface specification

The service and diagnostics interface X3 is designed as an Ethernet interface. It is only suitable for connecting a PC for commissioning, service and diagnostics with the software JetSym.

Technical specification:
- Transfer rate 10/100 Mbit/s BASE-T
- Transfer profile complies with IEEE802.3
- Connection via typical crossover cable (see also Jetter accessories catalog)

3.11 Option 1

Depending on the design variant of the servo amplifier JM-1432, option 1 is executed with EtherCAT at the factory.

You will find all available options in the Jetter industry catalog.

Detailed information is available on request.

3.12 Option 2

Option 2 can be equipped with different technology options at the factory. For example, additional or special encoders can be evaluated here.

You will find all available options in the Jetter industry catalog.

Detailed information is available on request.
3.13 Encoder connection

All encoder connections are located on the top of the device.

Fig. 11 Motor/encoder cable allocation

3.13.1 Jetter motor encoder connection

To connect the Jetter synchronous motors, please use the pre-assembled motor and encoder cable from Jetter AG.

3.13.2 Motor/encoder cable allocation to servo amplifier

Compare the component type plates. Make absolutely certain that you use the correct components according to a variant A, B or C!

<table>
<thead>

</tbody>
</table>

Table 19 Encoder types for use at X7

**NOTICE**

- The use of encoders other than those specified by the Jetter delivery program requires a special release through Jetter AG.
- The maximum signal input frequency is 500 kHz.
- Encoders with a supply voltage of 5 V ± 5 % must have a separate connection for a sensor cable. The sensor cable is used for recording the actual supply voltage at the encoder, whereby a voltage drop in the cable can be compensated. Only use of the sensor cable can ensure that the encoder is supplied with the correct voltage. Always connect the sensor cable.

Select the cable type according to the motor or encoder manufacturer’s specifications. Please take note of the following general conditions thereby:

- Only use shielded cables. Connect the shielding at both ends.
- Wire the differential track signals A/B, R or CLK, DATA via wires twisted in pairs.
- Do not unravel the encoder cable to, for example, route the signals via terminals in the control cabinet.
## Installation

**Figure** Pin X7 | SinCos and TTL | SinCos absolute value encoder SSI/EnDat | Absolute value encoder EnDat (digital) | Absolute value encoder HIPERFACE®
---|---|---|---|---
1 | A- | A- | - | REFCOS
2 | A+ | A+ | - | +COS
3 | DC 5 V ± 5 %, IO\textsubscript{UT\textsubscript{max}} = 250 mA (150 mA for hardware versions 0 to 1), monitoring via sensor cable | 7 ... 12 V (typical 11 V) max. 100 mA | |
4 | - | Data + | Data + | Data +
5 | - | Data - | Data - |
6 | B- | B- | - | REFSIN
7 | - | - | - | U\textsubscript{s} - switch
8 | GND | GND | GND | GND
9 | R- | - | - | -
10 | R+ | - | - | -
11 | B+ | B+ | - | +SIN
12 | Sense + | Sense + | Sense+ | U\textsubscript{s} - switch
13 | Sense - | Sense - | Sense - | -
14 | - | CLK+ | CLK+ | -
15 | - | CLK- | CLK- | -

**NOTICE** The encoder supply at X7/3 is short-circuit-proof in both 5 V operation and 11 V operation. The servo amplifier remains in operation as long as a corresponding fault message can be generated during evaluation of the encoder signals.

---

**Table 20 Plug connection X7 pin allocation**

The sum of the currents taken from X7/3 and X6/4 must not exceed the specified value.

After pin 7 is connected with pin 12, a voltage of 11.8 V is set at X7, pin 3!
## 3.14 Motor connection

<td>Shielding to reduce interference signals; connect shielding at both ends.</td>
</tr>
</tbody>
</table>

Table 21 Motor connection

**ATTENTION!**
The temperature sensor can also be connected to X6/5 and X6/9 via the resolver cable. However, this requires a reinforced insulation per EN 61800-5-1 between PTC and motor winding. To connect X5, make sure the temperature sensor used has basic insulation with respect to the motor winding per EN 61800-5-1.

**NOTICE**
If a ground fault or a short circuit in the motor cable occur during operation, the output stage is locked and a fault message is generated.

### 3.14.1 Jetter motor connection

**NOTICE**
To connect the Jetter servo motors, please use a pre-assembled motor cable (see motor catalog).

![Motor connection diagram](image)

**Fig. 12 Motor connection at BG4**
3.14.2 Switching in the motor cable

ATTENTION!

- Switching in the motor cable must always be done in a de-energized state with deactivated output stage; otherwise problems such as burnt-out contactor contacts may occur.
- To ensure switching-on takes place without power, make sure that the motor contactor contacts are closed before the servo amplifier output stage is released.
- At contactor tripping torque, it is necessary for the contacts to remain closed until the servo amplifier output stage is switched off and the motor current is 0. This is achieved by including corresponding safety times for tripping the motor contactor in the control process of your machine.

Despite this measure, the possibility of the servo amplifier faulting when switching in the motor cable cannot be excluded.

3.15 Brake resistor

In generator operation, e.g., when braking the drive, the motor energy is supplied back to the servo amplifier. This increases the voltage in the DC link (DCL). If the voltage exceeds the tripping threshold, the internal brake chopper transistor is switched on and the generated energy is converted to heat via a brake resistor.

<table>

</tr>
<tr>
<td>JM-1432</td>
<td>DC 390 V</td>
</tr>
</tbody>
</table>

Table 22 Brake chopper tripping thresholds (DC link voltage)
3.15.1 Protection for fault in brake chopper

ATTENTION!
The fault messages in JM-1000 (also BC_FAIL as protection for faults in the brake chopper) are parameterized so that the relay output DO04 opens when a severe fault occurs.

We recommend integrating relay DO04 into the actuation of the power contactor for the JM-1000 supply with AC 400 V.

3.15.2 Version with integrated brake resistor

Only the peak braking power for the servo amplifier with integrated brake resistor (version JM-1xxx-xxR1xxx, only available up to BG4) is specified in the catalog. The permissible continuous braking power must be calculated. It is dependent on the effective load on the servo amplifier present in the specific application.

ATTENTION!
Do not connect any additional external brake resistors to the servo amplifier JM-1432 with integrated brake resistor.

In principle, the thermal aspects of the servo amplifier are designed so that in continuous operation with rated current and maximum environmental temperature, no energy input through the external brake resistor is permitted. Therefore the drive version with integrated brake resistor is only reasonable if the effective load on the servo amplifier is ≤ 80 %, or if the brake resistor is intended for a one-time emergency stop.

In case of an emergency stop, only the heat capacity of the brake resistor can be used for a one-time braking process. Please take the permissible energy $W_{Br}$ from the following table:

<table>
<thead>
<tr>
<th>Device</th>
<th>Technology</th>

\(^1\) Data referenced to 3 x 400 V mains voltage (BR tripping threshold DC 650 V)
\(^2\) Data referenced to 3 x 460 V mains voltage (BR tripping threshold DC 745 V)
\(^3\) Data referenced to 3 x 480 V mains voltage (BR tripping threshold DC 765 V)

Table 23 Integrated brake resistor data (version JM 1432)

If the drive is not continually operated at its power limits, the reduced power dissipation of the drive can be used as braking power.
**NOTICE**

The following calculations assume servo amplifier operation at maximum ambient temperature. I.e., an additional energy input via the internal brake resistor due to a lower ambient temperature was not considered.

To calculate the continuous braking power, proceed as follows:

- **Calculation of the effective load on the servo amplifier in cycle** $T$:
  
  \[
  I_{\text{eff}} = \sqrt[4]{\frac{1}{T} \int_0^T i^2 \, dt}
  \]

- **Determination of the continuous braking power from unused drive power**:
  
  \[
  P_{\text{Br}} = \left[1 - \frac{I_{\text{eff}}}{I_N}\right] \times K1
  \]

**General conditions**

- A single braking process must not exceed the maximum pulse energy of the brake resistor.
  
  \[
  W_{\text{Br}} \geq P_{\text{Br}} \times T_{\text{Br}}
  \]

- The continuous braking power calculated for the device must be greater than the effective braking power of one drive cycle.
  
  \[
  P_{\text{Br}} \geq \frac{1}{T} \int_0^T P_{\text{Br}} \, dt_{\text{Br}}
  \]

This yields the minimum permissible time for cycle $T$ at the calculated continuous braking power:

\[
T = \frac{P_{\text{Br}}}{P_{\text{DBr}}} \times \int_0^T dt_{\text{Br}}
\]

The maximum total tripping time of the brake resistor in a predetermined cycle $T$ at the calculated continuous braking power results from:

\[
T_{\text{BrSum}} = \frac{P_{\text{DBr}}}{P_{\text{Br}}} \times T
\]
3.15.3 Connecting an external braking resistor

**DANGER of electrical voltage!**

**Risk of death!**

The connection L+ (BG4) is permanently switched to DC-link potential (> DC 300 V). The connection is not protected within the device. Never wire or loosen live electrical connections!

Before performing any kind of work, disconnect the device from the mains supply. Dangerous high voltages ≥ 50 V may be present even 30 minutes after disconnection from mains power (capacitor charge). Therefore check that no voltages are present!

**ATTENTION!**

- Observe the braking resistor mounting instructions without fail.
- Wire the temperature sensor (bimetal switch) on the braking resistor in such a way that if the braking resistor overheats, the output stage is deactivated and the connected drive controller is disconnected from the mains.
- The minimum permissible externally installed brake resistance must not be fallen below and the permissible continuous braking power must not be exceeded; see technical specifications, chapter C in Appendix, from page 57.
- Connect the braking resistor with a shielded cable.

**ATTENTION!**

Do not connect any additional external braking resistors to servo amplifiers with integrated brake resistor.

**NOTICE**

You will find the exact specifications, especially surface temperature, maximum connection voltage and high voltage resistance, in the JM-1432 Jetter industry catalog. For detailed information about the design of the braking resistor, please contact your project engineer.
4 Commissioning

4.1 Instructions for operating

ATTENTION!

Safety instructions

- During operation, observe the safety information in chapter 1, page 10.

During operation

- Prevent foreign objects and moisture from entering the device.
- Keep aggressive or conductive materials away from the surrounding area.
- Do not permit the ventilation openings to be covered.

Cooling

- The device heats up during operation and can reach temperatures of up to 100 °C at the heat sink. There is a danger of skin burns from touching the device.
- It must be possible for cool air to flow through the device with no obstructions.

4.2 Initial commissioning

After the JM-1432 has been installed according to chapter 2 and wired with all necessary voltage supplies and external components as described in chapter 3, initial commissioning takes place with the assistance of JetSym and a JetControl as described in the JetSym online help.

NOTICE

Details of the STO (Safe Torque Off) were not taken into account for the initial commissioning. You will find all information about the function STO in the 24-language document Description of the STO safety function (item no. 60879033).
4.2.1 Switching on the control supply

To initialize and set the parameters, first switch on the 24 V control supply. Do **not** switch on the AC mains supply yet!

Display readout after control supply is switched on

<table>
<thead>
<tr>
<th>D1</th>
<th>D2</th>

<td>Not ready to be switched on</td>
</tr>
</tbody>
</table>

Table 24 Initial state of the JM-1432 (when DC 24 V control supply is connected)

**NOTICE** You will find details of the control supply in chapter 3.7 *Connecting the supply voltages* from page 28.

4.2.2 Setting the parameters

The drive system settings are made with JetSym. Launch JetSym and open the JetSym online help.

**NOTICE**

- **Help system**
  For a detailed description of the initial commissioning, please refer to the JetSym online help.

- **Motor dataset**
  When using Jetter servo motors, the corresponding motor dataset can be selected in JetSym.

4.2.3 Drive control by a JetControl

Switch on the AC mains supply.
Then enable the output stage and activate the controls.
The drive should be tested without any mechanisms connecte!

**DANGER from rotating parts!**
Risk of death from uncontrolled rotation!
- Before initial commissioning of motors with a parallel feather key at the
  shaft end, secure the feather key against being ejected if this is not
  prevented by drive elements such as belt pulleys, couplings, etc.

**ATTENTION!**
Prevent damage by motor testing!
- In this case, ensure that nothing is damaged by testing the system! Pay
  particular attention to the limits of the travel range.
- Please note that you are responsible yourself for safe operation. Jetter AG
  is not liable for any damage that occurs under any circumstances.

**Destruction of the motor!**
- Specific motors are intended for operation on the servo amplifier.
  Direct connection to the mains can destroy the motor.
- The motor surfaces can become extremely hot. Do not place or fasten any
  temperature-sensitive parts on the motor surfaces; where necessary, provide
  protective measures against contact.
- To prevent the motor from overheating, the motor holding brake installed in
  the winding must be connected to the servo amplifier temperature
  monitoring (X5 or X6).
- Before initial commissioning of the motor, check that the motor brake (if
  present) functions flawlessly. Motor holding brakes are only designed for a
  limited number of emergency braking operations. Using them as a working
  brake is forbidden!

Table 25 Display D1/D2 after AC mains supply is switched on

**NOTICE**
- Inputs **ISDSH** and **ENPO**
  For step 1 from Table 26, at least the two inputs **ISDSH** and **ENPO** on terminal X4 must be wired.
**Sequence for switching on the drive**

**Step 1:**
Deactivate the STO safety function by setting the inputs ISDSH and ENPO.

**Step 2:**
Activate **START CONTROL** at the earliest 2 ms after step 1 and set the speed setpoint value.

**Step 3:**
Observe your system/plant and check the drive response.

\( t \) = Motor-dependent delay time

4.3 Serial commissioning

An existing parameter dataset can be transferred to other JM-1432 servo amplifiers by using JetSym online help. For details, please refer to the JetSym online help.

4.4 Integrated operating unit

The built-in operating unit permits diagnosis of the JM-1432. The operating unit comprises the following elements, all located on the front of the device:

- 2-digit 7-segment display (D1, D2)
- Two pushbuttons (T1, T2)
- MMC slot (X1)

The following functions and displays are available:

- Display of device state (see chapter 5.1.1, from page 51)
  The device state is displayed after the control voltage is switched on. If there is no pushbutton entry within 60 seconds, the device state display is reset.

- Display of device fault (see chapter 5.1.2, from page 52)
  If there is a device fault, the display is immediately changed to the fault codes.
5  Diagnostics

5.1  Status display on the device

The device states are displayed on the device via the 7-segment display.

<td>↑ After about 1 s, display skips back to “Er”</td>
</tr>
</tbody>
</table>

Table 29 Fault code display

**NOTICE**  
**Acknowledge error**

The faults can be confirmed according to their programmed reaction (Er) or can only be set back by a 24 V reset (X9/X10) (Er). Faults marked by a point can only be reset after the cause of the fault has been remedied.
5.2 Hotline/Support and service

If you have technical questions about project engineering or commissioning the servo amplifier, our hotline can provide you with fast, focused assistance. Before contacting us, please have the following information ready:

- Type designation, serial number and software version of the device (see software nameplate)
- JetSym version used (Menu ►Help ►Info for JetSym…)
- Displayed fault code (corresponding to 7-segment display or JetSym)
- Description of fault, how it started and the general conditions
- JetSym device settings saved in a file
- Name of company and contact partner, telephone number and e-mail-address

The hotline can be reached by telephone, e-mail or Internet:

Service times: Monday through Thursday 8:00 a.m. to 5:00 p.m. (CET) and Friday from 8:00 a.m. to 3:00 p.m. (CET)

Phone: (+49) 7141-2550-444
Email: hotline@jetter.de
Internet: www.jetter.de ►Support

NOTICE If you need consultation beyond the scope of the hotline, you will find all offered services in the industry catalog. You can download the industry catalog from our Internet site www.jetter.de under the heading Quicklinks.
6 Safe Torque Off (STO)

NOTICE  For any kind of information on the function STO, please refer to our 24-language document *Description of the STO safety function* (Item no. 60879033).
Appendix

A: Servo amplifier current carrying capacity

The maximum permissible output current and the peak current of the servo-amplifier are dependent on the mains voltage, the length of the motor cables, the output stage switching frequency, the type of cooling technology and the ambient temperature.

If any of the operating conditions changes, so does the maximum servo amplifier current carrying capacity.

<td></td>
</tr>
<tr>
<td>Relative humidity</td>
<td>5 to 85 % without condensation</td>
</tr>
</tbody>
</table>

7) The absolute humidity is limited to 60 g/m³ max. This means that, at 70 °C for example, the relative humidity must still be 40 °C max.
8) The absolute humidity is limited to a maximum of 29 g/m³. The maximum values for temperature and relative humidity listed in the table must not occur at the same time.
9) The absolute humidity is limited to 25 g/m³ max. This means that the maximum values listed in the table for temperature and relative humidity must not occur at the same time.

¹ Notice: These devices are only intended for stationary use.

---

**ATTENTION!**

**Control cabinet - IP54 min. for STO**

- According to EN ISO 13849-2, when the STO (Safe Torque OFF) function is used, the control cabinet must have a protection class of IP54 or higher.

**No continued shocks!**

- Do not install servo amplifiers in areas where they will be exposed to continued shocks.
G: Line filter

You will find details for the topic *Electromagnetic compatibility* in chapter 3.1 *Information on the installation* from page 18.

The following table shows the permissible motor cable lengths in compliance with the standard EN 61800-3.

<table>

C3 = Second environment (industrial)
C2 = First environment (residential)

1) The motor shielding connection is not located on the shielding plate, but directly on the device connection terminals.

Table 39 Permissible motor cable lengths
Appendix

H: UL approval

Measures to comply with UL approval (UL 508C) BG4

- Only operate these devices on mains with overvoltage category III.
- The devices can be used in mains with a maximum current carrying capacity of 5 kA, with phase-symmetrical current and maximum voltage of 480 V, with mains fusing to Table 40.
- These devices are intended for installation in an environment with a measured degree of contamination of 2 to EN 60664-1.
- The integrated short-circuit fuse is not intended as a protective device for branch cables. Execute the protective device for branch cables in compliance with the manufacturer’s instructions, the NEC regulations (National Electrical Code) and other applicable local standards.
- Use only UL-approved device connection cables (mains, motor and control cables):
  - Use copper conductors with temperature resistance of at least 75 °C.
  - For the required stud torques for connection terminals, see Table 40.
- For the maximum ambient air temperature, see Table 37 on page 59.
- For the relay output OSD04, use an isolated voltage supply with a rated voltage of DC 24 V with an output fused externally with a 4 A fuse to UL 248.
